

David Biddle (Binghamton)

On the Size and Connectivity of Graphs of Generating Sets of Finitely Generated Groups

Abstract for the Combinatorics and Algebra Seminars 2011 October 25

Let G be a finitely generated group with minimal generating set of size d . For each $t \geq d$ let $\Gamma_t = \Gamma_t(G)$ be the graph with vertex set V consisting of all generating t -tuples of elements of G and with edges $^{1)}$ if for some distinct i and j , g'_i is g_i multiplied on left or right by $g_j^{\pm 1}$, and all other g'_k are the same as the corresponding g_k .

Following work by Graham and Diaconis I examine connectivity properties of these graphs when G is abelian and when G is a small symmetric group. (For instance, $|V(\Gamma_3(\Sigma_4))| = 10,080!!$). Pictures will be provided free of charge.

I will relate the size and connectivity properties of these graphs to classic counting problems of Phillip Hall.

¹⁾ $(g_1, \dots, g_t), (g'_1, \dots, g'_t)$
