TITLE:	On a Diffusion Process that Arises in Quickest Change-Point Detection

Abstract

We consider the diffusion $(R_t)_{t = 0}\$ generated by the stochastic differential equation $dR_t = dt + mu R_t dB_t$ with $R_0 = 0$, where mu = 0 is given and $(B_t)_{t = 0}$ is standard Brownian motion. We obtain a closed-from expression for the quasi-stationary distribution of $(R_t)_{t = 0}$, i.e., the limit $Q_A(x) = \lim_{t = 0} t < 0$, where $T_A = \inf_{t = 0} t < 0$, where A = 0 fixed. The process $(R_t)_{t = 0}$, its quasi-stationary distribution $Q_A(x)$, x = 0, and the stopping time T_A are of importance in the theory of quickest change-point detection, especially the case when A is large. We study the asymptotic behavior of $Q_A(x)$ for large A is, and provide an order-three asymptotic approximation.
