Week 12	Topics
11/05/2018	Sylow Theorems
	Examples: (1) $ G =35$ (2) $ G =455$ (3) $ G =21$ (4) $ G =256$
11/06/2018	Test 2
11/07/2018	Rings. Definitions: ring, unity, ring with unity (unitary ring), commutative ring, units of a unitary ring
	Examples
	Prop: The units of a ring, $U(R)$ form a multiplicative group.
11/09/2018	No class.
Week 13	Topics
11/12/2018	Thm. 12.1
	Thm. 12.2
	Subrings, definition, examples
	Direct Products (Sums), definition, examples
	Ring homomorphisms, definition
	kernel, Ideal
	Homo, mono, epi, iso, endo, auto
11/13/2018	Test 2 returned

	R/I definition
	Thm. 12.3
	Integral Domains, zero-divisors
	Prop. Let R be a commutative ring. TFAE
	(1) R has no zero-divisors
	(2) R satisfies the cancellation law: $ab=ac$ and $a \neq 0 \implies b=c$.
	(3) R satisfies: $ab=0 \implies a=0 \text{ or } b=0$
	Definition: integral domain
	Examples: \mathbb{Z} , \mathbb{Q} , \mathbb{R} , \mathbb{C} , $\mathbb{Q}(\sqrt{2})$, \mathbb{Z}_p .
	Thm. (1) Any field is an integral domain.
	(2) Any finite ID is a field.
	Cor: \mathbb{Z}_n is a field iff it is an ID iff n is a prime.
11/14/2018	Examples: $\mathbb{Q}(\sqrt{2})$ is a field.
	$\mathbb{Z}_3[i]$ is a field.
	$\mathbb{Z}_5[i]$ is not a field.
	Prop: If R is an ID, then $R[x]$ is an ID, and for any $f, g \in R[x]$ we have $\deg(fg) = \deg(f) + \deg(g)$.
	Example: $\mathbb{Z}_6[x]$ is not an ID and the degree formula does not hold.
11/16/2018	Snow day. Class cancelled.
Week 14	Topics
11/19/2018	
	(1) $\langle a \rangle := \{ar \mid r \in R\}$ is an ideal of R .
	(2) $a \in \langle a \rangle$.
	(3) If $I \triangleleft R$ and $a \in I$ then $\langle a \rangle \triangleleft I$.
	Def: $\langle a \rangle$ is called the ideal generated by a . It is the smallest ideal of R that contains a .
	Example: In the ring $\mathbb{Q}[x]/\langle x^2-2 \rangle$ the element $u=x+i$ where $i=\sqrt{-1}$ satisfies $u^2=2$, i.e. it is a root of the polynomial x^2-2 .
	Characteristic of a ring. Thms. 13.3 and 13.4.
11/20/2018	Comparison of $\mathbb{Q}(\sqrt{2})$ and $\mathbb{Q}[x]/\langle x^2-2 \rangle$. Intuitive motivation for the construction $\mathbb{Q}[x]/\langle x^2-2 \rangle$.
	Given a commutative ring with unity R , and an ideal $I \triangleleft R$,
	(Q1) when is R/I an I.D.?
	(Q2) when is R/I a field?
	Def: prime ideal
	Thm 14.3. R/I is an ID iff I is a prime ideal.
Week 15	Topics
11/26/2018	Lemma: Let R be a commutative ring with unity, and $I, J \triangleleft R$.
	(1) $\langle I \cap J \rangle \triangleleft R$
	* $\langle I \cap J \rangle \triangleleft I, J$
	* if $K \triangleleft R$ and $K \triangleleft I, J$ then $K \triangleleft I \cap J$.
	(2) $\langle I+J \rangle := \{x+y \mid x \in I, y \in J\} \triangleleft R$
	* $I, J \triangleleft I+J$

	* if $K \leq R$ and $I, J \leq K$ then $I+J \leq K$.
	Prop: The set $\text{Idl}(R) := \{I \mid I \leq R\}$ of ideals of R is a lattice, i.e. a partially ordered set, in which any two elements have a glb and a lub .
	Cor: Let R be a commutative ring with unity and $I \leq R$. If I is maximal then it is prime.
11/27/2018	Board presentation, PS 11.
	Example: $R = \mathbb{Z}[x]$, $I = \langle x \rangle$ is a prime ideal but it is not maximal.
	Fact: In the ring \mathbb{Z} every ideal is a principal ideal, and every prime ideal is maximal.
11/28/2018	Def: Principal ideal domain (PID).
	Prop: \mathbb{Z} is a principal ideal domain.
	Thm: If R is a PID and $I \leq R$ is prime then I is a maximal proper ideal.
	Cor: $\mathbb{Z}[x]$ is not a PID.
	Example: in $\mathbb{Z}[x]$ the ideal $K = \langle 2 \rangle + \langle x \rangle$ is not a principal ideal.
	Chapter 15. Divisibility by 9 criterion.
	Divisibility by 7 criterion: $n = 10m + d_0$ is divisible by 7 iff $m - 2d_0$ is divisible by 7
11/30/2018	Thm 15.1
	Thm. 15.3
	Lemma: Let R be a ring with unity. For $a, b \in R$, $n, m \in \mathbb{Z}$, $(m \cdot a)(n \cdot b) = (mn) \cdot (ab)$
	Thm. 15.5
Week 16	Topics
12/03/2018	Corollaries 1, 2, and 3.
	Field of fractions(quotients)
12/04/2018	Thm. 15.6 Moreover, F is minimal. If E is a field that contains a copy of D , then E contains a copy of F .
	Examples. 1) The field of fractions of \mathbb{Z} is \mathbb{Q} .
	2) Let D be an integral domain, and $D[x]$ the ring of polynomials over D . The field of fractions of $D[x]$ is denoted by $D(x)$, and its elements are called <i>rational functions</i> over D . A <i>rational function</i> is a quotient of two polynomials $f(x)/g(x)$, with $g(x) \neq 0$.
	External and internal direct product of groups.
	Def: Internal semi direct product of groups. Given a group G , $N \leq G$, $H \leq G$ such that $N \cap H = 1$ and $NH = G$, we say that G is the (internal) semi direct product of N and H .
12/05/2018	Def: External semi direct product. Given two groups N and H and a homomorphism $\alpha: H \rightarrow \text{Aut}(N)$, write $\alpha(h)$ as α_h . Consider the cartesian product $N \times H$ with the following operation: $(n_1, h_1)(n_2, h_2) = (n_1 \alpha_{h_1}(n_2), h_1 h_2)$
	Thm: 1) The operation just defined makes $N \times H$ into a group. We denote it by $N \rtimes_{\alpha} H$. We omit the subscript α is it is understood from the context.
	2) $\bar{N} = \{(n, 1) \mid n \in N\}$ is a normal subgroup of $N \rtimes_{\alpha} H$, isomorphic to N , via the map $N \rightarrow N \rtimes_{\alpha} H \mid n \mapsto (n, 1)$.
	3) $\bar{H} = \{(1, h) \mid h \in H\}$ is a subgroup of $N \rtimes_{\alpha} H$, isomorphic to H , via the map $H \rightarrow N \rtimes_{\alpha} H \mid h \mapsto (1, h)$.
	4) $\bar{N} \cap \bar{H} = 1$ and $\bar{N} \bar{H} = N \rtimes_{\alpha} H$.

	5) $N \rtimes_{\alpha} H$ is the internal semi direct product of \bar{N} and \bar{H} .
	6) Given $h \in H$ and $n \in N$, conjugation of \bar{n} by \bar{h} is given by $\varphi_{\bar{h}}(\bar{n}) = \overline{\alpha_h(n)}$.
	Cor: When α is the trivial homomorphism, i.e. $\alpha_h = 1$ for all $h \in H$, then the semi direct product is equal to the direct product, $N \rtimes_{\alpha} H = N \oplus H$.
	Cor: The operation in $N \rtimes_{\alpha} H$ is completely determined by the operations in N and H , and the relation $\bar{h} \bar{n} = \overline{\alpha_h(n)} \bar{h}$.
	Example: Let $N = \langle a \rangle$ be cyclic of order 7, and $H = \langle b \rangle$ cyclic of order 3. $\text{Aut}(N) \cong U_7$ is abelian of order 6, hence cyclic.
	$s: N \rightarrow N, a \mapsto a^2$ is an automorphism of N of order 3 since $a^{2^3} = a^8 = a$.
	$\text{Aut}(N)$ is generated by $c: N \rightarrow N, a \mapsto a^3$, and $s = c^2$, since $a^{3^2} = a^9 = a^2$.
	Any homomorphism $\alpha: H \rightarrow \text{Aut}(N)$ has to map b , which has order 3, to an element of $\text{Aut}(N)$ of order a divisor of 3. The only such elements are $1, s$ and $s^{-1} = c^4 = s^2$.
12/07/2018	Board presentation PS 12
	Continuation of example. There are three different semi direct product of N and H , given by the three automorphisms $\alpha(b) = 1, \beta(b) = s$, and $\gamma(b) = s^2$. Let's write down the three.
	Case 1: $\alpha(b) = 1$ is trivial. In this case $N \rtimes_{\alpha} H = N \oplus H \cong C_{21}$.
	Case 2: $\beta(b) = s$. $ba = \beta_b(a)b = s(a)b = a^2b$ so $N \rtimes_{\beta} H$ is not abelian, and not isomorphic to case 1.
	Case 3: To distinguish from case 2, let's write $N = \langle u \rangle$ cyclic of order 7, and $H = \langle v \rangle$ cyclic of order 3, $\gamma(v) = s^2$. $vu = \gamma_v(u)v = s^2(u)v = u^4v$
	Again $N \rtimes_{\gamma} H$ is not abelian, not isomorphic to case 1.
	Claim: $N \rtimes_{\beta} H$ is isomorphic to $N \rtimes_{\gamma} H$ via the map $a \mapsto u, b \mapsto v^{-1}$.
	Cor: there are only two non-isomorphic semi direct products of a cyclic group of order 7 and a cyclic group of order 3, namely, the direct product, and the non-abelian semi direct product of case 2.
	Example: Let G be a group of order 21. By Sylow's theorem we have $n_7 = 1$. Let N be the Sylow 7-subgroup of G . We also know that n_3 is either 1 or 7. Let H be a Sylow 3-subgroup of G . When $n_3 = 1$ H is a normal subgroup of G and G is the direct product of N and H . When $n_3 = 7$, then H is not normal, and G is the non-abelian semi direct product of N and H .
	Therefore, there are exactly two non-isomorphic groups of order 21.
