## Lifting Inequalities for Polytopes

### Abstract for the Combinatorics and Number Theory Seminar 2002 October 9

The  $f$ -vector enumerates the number of faces of a convex polytope according to dimension. The flag  $f$ -vector is a refinement of the  $f$ -vector since it enumerates face incidences of the polytope. To classify the set of flag  $f$ -vectors of polytopes is an open problem in discrete geometry. This was settled for 3-dimensional polytopes by Steinitz a century ago. However, already in dimension 4 the problem is open.

I will discuss the known linear inequalities for the flag  $f$ -vector of polytopes. These inequalities include the non-negativity of the toric  $g$ -vector, that the simplex minimizes the  $cd$ -index, and the Kalai convolution of inequalities.

I will introduce a method of lifting inequalities from lower-dimensional polytopes to higher dimensions. As a result we obtain two new inequalities for 6-dimensional polytopes.

The talk will be accessible to a general audience.
