## Moving Faces to Other Places: Facet Derangements of the Hypercube

### Abstract for the Combinatorics Seminar 2013 May 14

When you roll a die, what is the probability that every face has been moved to another location? Starting from this simple problem, I look at integer sequences associated with the number of facet derangements of an  $n$ -dimensional hypercube. I briefly survey some previous work, discuss a reformulation of the problem, and give recursive and non-recursive formulas for the sequences.

This is joint work with Liz McMahon.
